

---

### **What is it?**

- A bacterial infection of the eye.

### **What are the symptoms?**

- Itchy irritated eyes.
- Whites of the eyes turn pink.
- Pus discharge from eyes. Eyes are often “glued shut” after sleeping.

### **How quickly do symptoms develop?**

- Within 1 to 3 days after coming in contact with the infection.

### **How is it spread?**

- Contact with discharges from the eye or upper respiratory tracts of infected people.
- ~~Examples — Sharing eye make-up or eye medications.~~
- Contaminating fingers with eye or throat discharges from an infected person and then touching your eyes.
- Indirectly through contaminated clothing, face cloths and towels or sharing eye-make up or eye medications

### **How long is it contagious?**

- As long as the eyes have discharge.
- Children with pink eye should not attend school/daycare until 24 hours after antibiotic has been started and the discharge has stopped.

### **How is it treated?**

- With an antibiotic.
- Sometimes the doctor will order an oral antibiotic as well as an antibiotic eye drop or ointment.

### **What can you do?**

- Do not share your face cloths or towels.
- Wash your hands after touching or wiping your eyes.
- Discard Kleenex soiled with eye or nose discharge into garbage container.

### **Whom should I talk to if I have any questions?**
